01. Brainstorming

Project Idea & Problem Exploration

PocketSmart AI is a Generative AI project titled “PocketSmart AI: Your Smart Budget & Recommendation Assistant.” The supplied project material identifies the project under the Generative AI with Google technology track.

The central idea is to create a smart assistant that helps users understand and plan personal budgets while also providing useful recommendations based on their spending goals and preferences.

The brainstorming stage focuses on identifying the user problem, possible features, target users, expected inputs, expected outputs, and the role of AI in making the application more useful than a simple calculator.

01. Brainstorming

Possible User Problems

Users may find it difficult to organize income and expenses in one place.

Users may not know how much they can safely allocate to different spending categories.

Users may need recommendations when planning purchases or events within a fixed budget.

Users may want simple explanations rather than complex financial terminology.

Users may benefit from an assistant that turns budget information into understandable suggestions.

01. Brainstorming

Initial Feature Ideas

User sign-in and a simple home interface.

Budget creation and expense-category planning.

Budget summaries and remaining-balance information.

Recommendation support using Generative AI.

Planning interfaces for different budget situations, such as general budgeting, parties or events, and jewellery-related planning where applicable to the project concept.

A clear interface that lets users enter information and receive readable recommendations.
