02. Requirement Analysis

Project Scope

The project scope is to design a Generative AI-powered budget and recommendation assistant named PocketSmart AI.

The supplied material gives the project title but does not provide a complete formal requirements specification. Therefore, the following requirements are organized as a practical project draft aligned with the stated project purpose.

The application should accept relevant budget information, process it, present useful summaries, and use AI to generate recommendations in a user-friendly form.

02. Requirement Analysis

Functional Requirements

The system should provide a home or dashboard interface.

The system should allow users to enter budget-related information such as available amount, categories, planned expenses, and goals.

The system should calculate or display budget totals and remaining amounts.

The system should provide recommendations based on the information supplied by the user.

The system should support user authentication if a sign-in page is included in the final application.

The interface should allow users to move between major budget-planning sections.

02. Requirement Analysis

Non-Functional Requirements

Usability: the interface should be understandable for users with basic computer knowledge.

Performance: common interactions should respond without unnecessary delay.

Reliability: invalid or incomplete input should be handled clearly.

Security: authentication information and user data should be handled carefully.

Maintainability: frontend, backend, AI integration, and configuration should be separated logically.

Compatibility: the application should be testable in a modern web browser.
