06. Project Testing

Testing Strategy

Testing should confirm that each major feature works independently and that the complete user flow works from entry to recommendation.

Testing should include normal inputs, empty inputs, invalid inputs, boundary values, and service/API failure cases.

The final test should be performed in the same environment used for the demonstration.

06. Project Testing

Functional Test Cases

TC-01: Open the application and verify that the initial page loads correctly.

TC-02: Enter valid budget information and verify that the application accepts it.

TC-03: Enter missing required information and verify that a clear validation message appears.

TC-04: Enter invalid numeric information and verify that it is rejected or handled safely.

TC-05: Navigate between the main planning sections and verify that links/buttons work.

TC-06: Request a recommendation with valid information and verify that a response is displayed.

TC-07: Simulate an AI/API failure and verify that the application shows a useful error state rather than crashing.

06. Project Testing

Acceptance Checklist

Application starts without avoidable runtime errors.

Major pages are reachable through the intended navigation.

Budget values are accepted and displayed correctly.

Validation prevents clearly invalid submissions.

Recommendation functionality can be triggered with valid input.

AI/API errors are handled visibly.

The complete demonstration flow can be completed from the starting page.
