08. Project Demonstration

Demonstration Objective

The demonstration should show the complete PocketSmart AI workflow from opening the application through entering budget information and receiving a recommendation.

The demonstration should focus on the working features that are actually implemented in the final project.

A short introduction should state the project name, problem being addressed, and the role of Generative AI.

08. Project Demonstration

Suggested Demonstration Flow

1. Start the application and show the initial page.
2. Show the sign-in page if authentication is part of the final build.
3. Open the main dashboard or home interface.
4. Open the budget planner.
5. Enter a sample budget and relevant categories.
6. Submit the information and show the budget result.
7. Trigger the recommendation feature.
8. Show the generated recommendation.
9. Demonstrate another relevant planning section if it is implemented.
10. Briefly explain how the frontend, application logic, and AI component work together.

08. Project Demonstration

Final Presentation Checklist

Application opens successfully.

All demonstrated buttons and navigation links work.

Sample inputs are prepared before the presentation.

AI/API configuration is working before the demonstration begins.

No secret API keys are shown on screen.

The presenter explains the problem, solution, main features, technology, testing, and result.

A final statement summarizes what the completed application demonstrates.
